I asked [ChatGPT](#) this question:

Is Artificial Intelligence an existential threat to mankind?

Here is the answer it gave:

As an AI language model, I cannot provide an opinion, but I can present some facts and arguments from different perspectives.

Some experts believe that Artificial Intelligence could become an existential threat to humanity if it surpassed human intelligence and became uncontrollable or hostile to human interests.

For example, if AI developed autonomous decision-making capabilities and decided to eliminate humans because they were deemed inefficient or a threat to the planet, it could become a catastrophic scenario. There are also concerns about "grey goo" scenarios where self-replicating nanobots created by AI consume all living matter on earth.

However, other experts argue that these scenarios are either exaggerated or highly unlikely. They emphasize that AI has a lot of potential to improve human life and create new opportunities in various fields, from healthcare to transportation, manufacturing, logistics, and environmental protection.

They also point out that we have the power to shape the evolution of AI through good governance, ethical guidelines, and responsible innovation. By designing AI systems that align with human values, we could harness its potential while minimizing its risks.

Ultimately, the answer to whether AI is an existential threat to mankind depends on the development strategies, governance practices, and ethical frameworks that guide its evolution and use.

Yeah, sure, I said to myself.
